SUMMARY

Backend-focused developer and Digital Game Design graduate with internship experience building REST APIs in C# / ASP.NET Core and developing a Unity mobile game. Strong grounding in layered architecture, Entity Framework Core, PostgreSQL, JWT authentication, Docker, and automated testing with CI. Seeking a junior backend developer role.

EDUCATION

Istinye University — Bachelor's Degree, Digital Game Design · GPA 3.21 / 4.00

Istanbul · 2022 – 2026

EXPERIENCE

Software Developer Intern · *KPlus Bilişim Teknolojileri A.Ş. / Asteri Game Studio*

Istanbul · Jun 2025 – Oct 2025

- Developed and tested backend features for business and application workflows using C#, ASP.NET Core, REST APIs, and SQL database operations.
- Built **Merge Vacuum**, a mobile casual puzzle game in Unity (C#, URP) for Asteri Game Studio, KPlus's in-house game studio, implementing the full gameplay loop, level-objective systems, and game-state UI flow across a 100+ script codebase.

PROJECTS

Game Services API — ASP.NET Core Web API, C#, EF Core, PostgreSQL, SignalR, Docker, xUnit ·

github.com/Efekoo/Game_Services_API · **live demo**

- Designed a four-layer solution (API / Business / Core / DataAccess) exposing seven domain controllers: authentication, user management, currency, inventory, market economy, friends, and leaderboards.
- Implemented JWT authentication with BCrypt password hashing; used Entity Framework Core against PostgreSQL for all data access, with Swagger documentation for every endpoint.
- Built a real-time leaderboard: a SignalR hub broadcasts live standings to all connected clients whenever a player gains XP.
- Containerized the stack with Docker Compose and wrote 24 xUnit unit and integration tests, run on every push by a GitHub Actions CI pipeline.

AeroRecover — Python, LangGraph, Google Gemini, Streamlit, Folium · github.com/Efekoo/AeroRecover

- Built a multi-agent AI application that generates post-flight recovery plans for pilots from flight duration, timezone shift, layover time, and location data.
- Orchestrated six specialized agents (flight lookup, stress analysis, recovery science, layover optimization, location advice, safety guardrail) in a LangGraph workflow, with the guardrail agent filtering unreliable recommendations.
- Delivered the app as a Streamlit interface with Folium map visualizations.

Investor — Algorithmic Trading Bot — Python, ccxt, pandas, SQLite, Optuna, Docker, pytest · github.com/Efekoo/Investor

- Built a modular trading bot: exchange abstraction over ccxt, eight pluggable strategies, and a risk module covering position sizing, stop-loss / trailing stop, and a daily circuit breaker.
- Developed a backtest engine simulating fees, slippage, and partial fills, with Optuna parameter optimization and SQLite persistence with crash-state recovery.
- Designed a layered live-trading safety model (paper / live / backtest modes, double confirmation gates, kill switch); 19 pytest tests run in GitHub Actions CI.

TECHNICAL SKILLS

- Backend:** C#, ASP.NET Core, Entity Framework Core, REST APIs, PostgreSQL, SQL Server, SignalR, JWT Authentication, BCrypt, Swagger / OpenAPI, AutoMapper, FluentValidation
- Testing & DevOps:** xUnit, pytest, Docker, Docker Compose, GitHub Actions CI
- Python:** pandas, ccxt, Optuna, LangGraph, Google Gemini API, Streamlit
- Game Development:** Unity, C#, Universal Render Pipeline
- Tools:** Git
